

How to Thread or Release A Ratchet Tie Down

Threading a Ratchet

- Open Ratchet Handle approximately 100°
- Split Axle should be oriented as shown to allow webbing to be fed through
- Feed webbing through the ratchet axle (from the backside of the ratchet)
- Feed webbing over the top of the axle
- Fasten hooks to the tie down points on your truck or trailer
- Pull webbing taut
- Pump ratchet until cargo is secure
- Tie off excess webbing and check to make sure cargo is secure

Releasing a Ratchet

- Squeeze release pawl and open the ratchet handle until it is approximately 180°
- Tug the ratchet strap out of the ratchet. Depending on the load you had tied down, you may need to unthread the strap from the ratchet mechanism entirely, or you might be able to just loosen the strap enough to slide it out of the way and remove the load.
